SEO Plan for Nexus Dev Studio

Site reviewed: nexus-devstudio.vercel.app

The site is built with Next.js (visible from the `_next` URLs), which is good for SEO because pages can be rendered on the server. This document lists what I found and the steps to take, in order.

Problems found

1. **The site is one page.** Services, Work, Reviews and Contact are all sections of the homepage (`/#services`). Google can only rank pages, so right now there is one page competing for everything. This is the biggest issue.
2. **The domain doesn't match.** The site runs on `nexus-devstudio.vercel.app` , but the tags point to `nexusdevstudio.com` . Google gets mixed signals, and a `vercel.app` address looks less trustworthy to clients.
3. **The meta description is too long.** Google cuts it off at about 155 characters, and the current one is around 210.
4. **The keywords are vague.** "AI engineering & full-stack studio" is not something people type into Google. They search things like "web development company in Lahore" or "Flutter app developer".

Step-by-step plan

Step 1: Connect your real domain

In Vercel, go to Settings → Domains and add `nexusdevstudio.com` , if you own it. Then redirect the vercel.app address to it.

Step 2: Set up Google Search Console

Add your domain, verify it, and submit your sitemap. This tells Google your site exists.

Step 3: Create separate pages

Use the ready content for these pages:

- `/services/web-app-development`

- `/services/mobile-app-development`
- `/services/ai-integration`
- `/services/wordpress-development`
- `/faq`
- `/work/hawalay`, plus one page per project (a case study with problem, solution and result)

Each page should target one main keyword, have one H1, and be at least 500 words.

Step 4: Fix the tags on every page

- **Title:** under 60 characters, with the keyword first. Example: `Flutter App Development Company | Nexus Dev Studio`
- **Description:** under 155 characters, written so people want to click
- **Canonical URL:** add a unique one to each page

Step 5: Add a sitemap and robots.txt

In Next.js, add `app/sitemap.ts` and `app/robots.ts`. Then open `/sitemap.xml` and `/robots.txt` on the live site to check they work. These could not be verified during the review.

Step 6: Add FAQ schema

Since the FAQs are ready, wrap them in FAQ structured data (JSON-LD). Also add `Organization` and `Service` schema. Test it for free with Google's Rich Results Test.

Step 7: Build trust and links

This is where most beginners stall.

- Create a **Google Business Profile**
- Keep the same name, email and phone number on Fiverr, Instagram, TikTok, Facebook and LinkedIn, and link them all to the website
- Add an email address or contact form next to the WhatsApp button, because some visitors won't use WhatsApp
- Over time, get listed on Clutch and GoodFirms, and publish blog posts to attract links

Decision needed: pick your target market

The team appears to be in Pakistan, the phone number is UK, and clients come from the UK, Germany and Georgia. The keywords differ a lot between "software company in Lahore" and "AI developers for hire UK", so this choice shapes the whole content plan.

Open question: which market do you want most clients from? Once that is decided, the next task is to choose exact keywords for each page and write the titles and meta descriptions.
